

II. With Apps for iOS/ Android

Depending on the type of use / integration of the signature server, various functions of our APPS [iSignatureOffice](#) and [aSignatureOffice](#) for iOS and Android are available:

LOGIN WITH USER

In case of using smartphones or tablets as standalone devices, it's suitable to use iSignatureOffice/aSignatureOffice function (Login with credentials).

It provides a full view of all documents before signing.

The assignment of the documents is user-related (registered user necessary), a document-related assignment is possible for projects.

SCAN QR-CODE

If a monitor of a desktop workstation or a laptop is used to view the documents and a small mobile device (smartphone) is used for signing only (= signature pad replacement),

the capture function of the apps iSignatureOffice/ aSignatureOffice can be used (no login with user credentials necessary).

The various apps are also available in projects as corresponding [Libraries](#) for integration into your own apps.

Further technical information on the capture function (if our service is integrated) can be found at [Capture function \(QR code scan\)](#).

You can find more information about our apps at following page: <https://www.stepover.com/signing-online/>.
